EZSecure

Protection of messages sent through Internet – Email – Instant Messengers – Blog – Forums

EZSecure was developed to answer a need for confidentiality in the exchange of your messages and files transiting through Internet. Industrial espionage, electronic surveillance, hostility or human errors can put in danger sensitive or personal information.

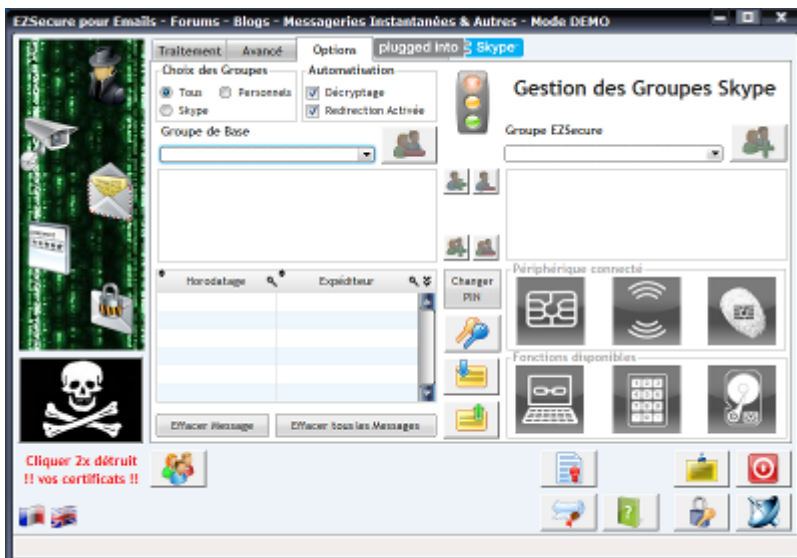

You write the message or choose the file which you wish to send, choose the addressee(s) in the list of the encoding certificates, then click the button "Encrypt the text". EZSecure enciphers the information by using one or several encryption protocols, and returns an inviolable message. The addressee will decipher it during its reception, EZSecure knowing which certificate has to be used for this operation.

The main window is allowing to make operations in a simple and effective way.

EZSecure contains several assistants to create the encoding certificates, and other complexes tasks. You can also proceed manually to perform them.

In Standard mode, 4 levels of encryption are available. In Pro mode, with an addition of a reading system using smart cards or RFID, as well as fingerprints, 6 levels of encryption are usable.

Available options offer the use of Skype messaging and management of its groups.

SmartCard readers, RFID readers, with or without fingerprints are recognized. Moving to the Pro version is automatic by simply adding a reader and the adequate cards.

You also increase the security level and protect the encoding certificates of encoding by storing them in the SmartCard or RFID. (According to the chosen option).

Maximum security at every level for a rock-bottom price.
